ABSTRACT

A multilayer PTC thermistor that can reliably decrease the resistance by decreasing the thickness of ceramic layers composed of a BaTiO₃ semiconductor ceramic and achieve a resistance close to the resistance calculated from the multilayer structure is provided.

The thermistor is adjusted to satisfy the conditions $5 \le X \le 18$ and $4 \le X \cdot Y \le 10$, wherein X is a thickness (µm) of each ceramic layer (2) between the internal electrodes (3) and Y is a donor content (8) in the barium titanate semiconductor ceramic constituting the ceramic layers (2), the Y being in terms of (number of donor atoms/number of Ti atoms) × 100.
